BIBLIOGRAPHY AND REFERENCES

Now it is possible to have lots of unsorted bibioentries, and use DB2LaTeX to process them, sort them and filter them. The descending sorting is done according to the tuple (xreflabel,id,abbrev).

In some documents, only the references that are explicitly cited should appear in the print output. With DB2LaTeX, you may use the variable `latex.biblio.output` :

- If `latex.biblio.output = 'all'`, all entries are output.
- If `latex.biblio.output = 'cited'`, only the cited/xreffed bibioentries.
